Techniques for implementing a support garment with at least one support assembly to provide lateral support to a body part, such as the male genitalia. The techniques may be used to provide immobility of the male genitalia following surgical or therapeutic procedures. A support garment for providing support to a male genitalia includes a lower torso portion including an interior surface and an exterior surface. The lower torso portion further includes a groin portion and at least one support assembly extending alongside at least a portion of a male genital region.
